

POND
AN
ALMANACK
for the yeare of our
LORD GOD
1655.

Being the third after Bissextile,
or Leap-yeare :

And from the Worlds creation,
according to the best account,
5659.

Amplified with many things of very good use, both
for pleasure and profit : And fitted for the
meridian of *Saffron Walden in Essex*,
where the Pole is elevated 52 de-
grees and six minutes above
the Horizon.

Whereunto are also added the severall Fairs held
in *England* each moneth this yeare.

CAMBRIDGE:

Printed by the Printers to the University. 1654.

The *Julian*
or *English*
account.

1655.

The *Gregori-
an* or *Roman*
account.

The beginning and ending of the Terms
(if the State alter them not, before this
Book comes to be of date) will
be as followeth:

Hilary Term beginneth on the 23 day of *Janu-
ary*, and endeth on the 12 of *February*.

Easter Term beginneth on the second day of
May, and endeth on the 28 of the same.

Trinity Term beginneth on the 15 day of *June*,
and endeth on the fourth of *July*.

Michaelmas Term beginneth on the 23 day o
October, and endeth on the 28 of *November*

The

The Anatomie of Mans body as the parts thereof
are governed by the twelve Signes.

✓ Head and face.

8 Neck and throat.
S Breast, stomach, and ribs.
Bowels and belly.
Secret members.
Knees

II Arms and shoulders.
Heart and back.
Reins and loyns.
Thighes.
Legs.
The feet.

Brief rules of Husbandry.

Plant and graft the Moon increasing, in *Taurus*
or *Aquarius*, the wind not Easternly.
Fell timber from Midsummer till Christmas, the
Moon increasing.
Fell Coppice & Fuel, the Moon in the first quarter.
Cut your Vines in February or March.
Geld cattell the Moon in *Aries*, *Sagittarius*, or
Capricorn.
Remove trees, the Moon at the last quarter in
November
Shear sheep, and cut hair to grow, ☾ increasing.
To keep thy hair safely from falling untimely,
Hot scalding baths denie, hate wanton company;
Abstain from Vencry, purge choler warily,
Let thee bloud needfully, surfet not willingly.

R Eader, would'st know when Easter here will fall,
What Sunday letter, when will be Leap-year,
The Golden Number, and the New Moons all
In February? These right under here
By their respective titles do appeare.
Also Vermillion figures shew at Rome
How much before our Easter theirs do come.

The use of the two former Tables.

IN the first table, and the first colūmne or space, you have the yeare of our Lord, beginning at 1629. &c.

In the next space, the Golden Number for every yeare; as for 1629 the Golden Number 15. &c.

In the third space, the day of the change of the Moon in February; as in 1629 the Moon changed February 13.

In the fourth space, how Easter day falleth every yeare; as in 1629 Easter day was April 5.

In the fifth space, the number of dayes differing betwixt the *Romane* or *Gregorian*, and our account in *England*, for the keeping of Easter, (and so by consequence all other moveable feasts thereon depending) as in 1629 there was no difference; but 1630 the *Romanes* kept their Easter 7 dayes before us; and in 1633 they kept their Easter 35 dayes, that is, five weekes, before us.

And in the last two spaces you have the Leap-yeare, and Sunday letter; as in 1629, and 1657, the Sunday letter D, and the first after Leap-yeare, &c.

The use of the second Table.

In this second table, you have in the first place the Sunday letter, and in the next the Golden Number whatsoever it be, from 1, to 19 inclusive.

The use whereof is, that for any yeare you (knowing the Golden Number, and Sunday letter) may there find the moveable feasts.

Example.

By the first table against the yeare 1655, I find the Golden Number 3, and the Dominicall letter G; then in the second table, and in the space answering G, I seek for the Golden Number 3, which I find in the fourth line of that table answering G, and against it in the same line, from Christmasse to Shrovefunday is 8 weekes & 6 daies; Shrovefunday February 25, Easter-day April 15, Rogation-sunday May 20, Whitsunday June 3, Advent-sunday Decemb. 23 the like for any other yeare.

Pond 1655.

Of the distinctions of times, viz. Yeares,
Moneths, Weeks, and Dayes.

A Year is Poeticall, viz. limited by the Cosmicall, A-
cronicall, &c. rising of some notable fixed star, or A-
stronomicall, according to the course of the Sun or Moon in
the Zodiack: this again is Solar or Lunar. The Solar also is
Tropicall or Sidereall. Tropicall, is the time wherein the
sun by his proper course, moveth through the Zodiack from
one Tropick to the same tropicall point again, and contain-
eth 365 dayes, 5 houres, and 49 minutes well nigh. The Si-
dereall is the time wherein by his course he arriveth to the
same fixed starre from whence he departed, and containeth
365 dayes, 6 houres and an half very near. The year Lunar
is also Common, or Embolismall. Common, consisting of
354, Embolismall, of 384 dayes, the first being lesse then the
other Solar year by 11 dayes, which is called the Epact, the
other exceeding the Solar year 19 dayes: whereupon it co-
meth to passe, that the Lunar year every third year hath 13
moons. Moneths are also Solar, Usuall, and Lunar: Solar
is the space that the sun continueth in one signe, and is mean
or equated. The Usuall, is the space of 30 or 31 dayes,
whereby Julius Cesar, by the help of Solignes, divided the
year into 12 parts, or moneths, then constituting the leap-
years, and divers other necessary distinctions or limits of the
years which are used at this day. Lunar is fourfold, that is,
of Peragrations, being of 27 dayes 7 houres, &c. in which
time the moon passeth through the zodiack. Apparition, the
time of 4 weeks. Medicinall, of 6 dayes. And of Consecu-
tion, being the time wherein she overtaketh the sunne after
her departure from him, being 29 dayes and an half. A week
is the space of 7 dayes. A day is Naturall, or Artificiall:
Naturall of 24 houres; Artificiall from sun-rise to sun-set.
An houre containeth 60 minutes: a minute 60 seconds: a se-
cond 60 thirds; and so on still as farre as you please.

January

January hath xxxi dayes.

First quarter the fifth day, foure min. past one afternoon.

Full moon the 12 day, 38 min. past foure in the morning.

Last quarter the 19 day, 51 min. past seven in the morning

New moon the 27 day, 50 min. past noon.

The beginning of this moneth is something rough.
 Saturn will be with Lady Luna on the tenth day, and
 Mars the nineteenth.
 Jupiter, Venus, and Mercury be all with her neare her
 change, and therefore hid under the Sunns mantle.

Neare about the second day, expect many showers, in regard that Venus and Mercury be then in conjunction. The wind blows then also as well as on the tenth and eleventh dayes.

Venus will be with the Pleiades the 17 day, Mars and the Moon not farre asunder then. And on the sixth day Saturn is with her.

Great winds about the fifth and eighth dayes of this
moneth, by reason of Jupiter who meets with the Moon,
Mercury, and the Sunne. And were it not thus late in
the yeare, I should think that on the eighth day would
be some thunder.

About S. Luke and foure dayes after, stormy winds and
wet good store.

An Elegie for the death of the yeare.

By T. K.

O Ft wants our light that lamp of light
which passeth all in fame;
Who by his force in Northern course
cold *Boreas* blasts can tame.
Gone are those houres when *April's* showers
to entertain the Spring,
And birds in woods on boughs and buds
did make their echoes ring.
That moneth of *May* in garments gay,
that vernall time was spide;
Now kept in aw by natures law
and forc't to leave that pride:
Valleys that green in *June* were seen,
till now could not abide,
The scorching heat of *Julies* threat
of beaurty them depriv'd.
We could not stay no not one day
of *August's* month so kind,
Though well approv'd, us dearly lov'd,
as once a year we find:
He doth resigne and yield his time
to the Autumnall season,
When leaves do fall and eke with all
such pleasant sights are geason.
Thus seasons fast with time flie past,
so swift doth *Phebus* ride,
We cannot clasp our hold so fast,
but from us soon they slide.

Of the Eclipses this yeare.

THe Sun will suffer two Eclipses this yeare; the first whereof may be seen of us in our Horizon: but it is a very small one, and will therefore not be much regarded of the common sort. Howbeit I will note the time when it happeneth, that they who list to look may see it. It is on the 27 day of January, and beginneth at London near 50 min. past high noon; is in the greatestt obscuracion at 26 min. past one, and endeth at 2 min past two: so that the whole time of its continuance is one houre and 12 min. *Quot horas durat Eclipsis Solis, et annorum duraturos effectus prænunciat:* How many houres the Sun is eclipsed so many yeares will the effects continue: *Sed parva Eclipses parum nocent, & in paucis operantur,* as saith Origanus.

The other Eclipse of the Sun is on the 23 day of July, about one in the morning, but not to be seen of us. In the more Southern parts of the earth it will be fully seen.

Argol speaks of two Eclipses more, and those to be of the Moon, the one on the eighth of July: the other on the seventh of August: But neither will his own, nor other mens Tables shew any, as they who please go make triall, may find.

And note that the effects of the last yeares great eclipse of the Sun, are very vigorous this year in the places under *Leo, Aquarius, Taurus,* and *Scorpio.*

Pond 1655.

The

Pond 1655.

The four quarters of this year. 1655.

First of the Spring.

{ European }	{ Persian }	{ Arabian }	{ Ethiopian }
moneths }	moneths }	moneths }	moneths }

{ March }	{ Pharevardin }	{ Ramachau }	{ Parmahath }
April }	Adarpahasht }	Shenuall }	Parmuda }
May }	Gharda }	Dbilkade }	Paschnes }

THe beginning of the Spring quarter, is accounted of the Astrologers as the time of the years birth: I will therefore begin with it, although something diverse to the common path. It begins with us the tenth day of *March*, 43 minutes past one in the afternoon.

The Sun then entring the first point of *Aries*, making the day and night equall to us, as to all the world. The temper of this quarter ordinarily and of course is hot and moist, of complexion sanguine, and is the years youthfull and growing age, lasting while the sun runs his course through *Aries*, *Taurus*, and *Gemini*. The state of the weather, as it depends upon the suns course to the fixed starres (and which would be constant, were there no intervention of other causes) is first dry: the sun having passed the section of the Equator with the Ecliptique, draws near to some hotter starres; and being nearer our zenith, both exhales and consumes the reliques of winters superfluity, helped by the Eastern winds, which then ordinarily blow. Hereby the earth is fit to receive the seeds that remain to be sown, and is also extimulated to generation: the trees thrusting forth buds, blossomes, leaves, and the earth braving it in her emerald-like vest, embellished and adorned with varietie of

Pond 1655.

Chrysanthemion spargles : all which with corn and fruits also, needing a present irrigation, opportunely the sun in *Taurus*, is accompanied in his morning-rising, with the *Pleiades* and *Hyades* toward the North; the *Hædi* toward the South: and soon after also *Orion*, waited upon also to bed with *Arcturus*. Which being tempestuous, stormy, and moist constellations, stirre up, and bring those pleasing showers, which being warmed by southerly and *Favonian* winds, are welcome to the tender and newly rooted plants. Lastly, the sunne in *Gemini* approching his height, stirs up a temperate heat, convenient to the increasing of fruits and plants.

The Summer quarter.

{ June	{ Thir	{ Dbilbaga	{ Penni
{ July	{ Mardad	{ Muharam	{ Epip
{ August	{ Sabeberiz	{ Sefar	{ Musri

THe Summer quarter takes his beginning (according to the account of Astronomers) with the suns entrance into the first point of the solstitiall signe *Cancer*, being with us the 11 day of *June* at 49 minutes past 4 a clock in the afternoon. Now are the dayes the longest, and the nights the shortest to all that dwell on this side the Equator, the day being with us at *Cambridge* 16 houres 34 minutes 36 seconds. The temper of this quarter is naturally hot and dry, of complexion cholerick. The sun being now ascended to his height, hath likewise with him brought all the earths furniture to their severall tropicks.

Now

Pond 1655.

Now herbs begin to form their seeds, and the fading flowers are succeeded by their fruits; and therefore need moisture to further their increase to their just quantitie. Fitly now the *Afelli* in *Cancer* rising with the sunne, stirs up showers to satisfie them with the latter rain: by the help whereof having seen their greatest, and now requiring heat for their full maturation, the sun enters the fire-breathing *Leo*, and is also accompanied with the morning rising of both the dogs, *Syrinx* and *Procyon*: whereby is stirred up great heat, to the hardning of grain, and ripening of all other fruits. Which yet is something tempered by the concomitancy of the *Etesian* winds. By this time the sunne being come into the terrestriall signe *Virgo*, the heat is abated; & the air, though still drie, yet cooler, that the husbandman may with more ease disrobe the fields, and furnish his barns. Lastly, this long drie now calling for moisture, the sun approaching to tempestuous and storm-breeding *Bootes*, by his morning rising with him, poures out store of rain to fill the chaps of the drie and gaping earth.

The Autumnall quarter.

{ <i>September</i> <i>October</i> <i>November</i>	}	<i>Mehar</i> <i>Aban</i> <i>Adar.</i>	}	<i>Rabie</i> <i>Rabie posterior</i> <i>Gumadbi</i>	}	<i>Tutb</i> <i>Paap</i> <i>Hatny</i>
--	---	---	---	--	---	--

THE Autumnall quarter begins with the sunnes entrance into the other equinoctiall signe *Libra*, which is the 13 of *September*, 48 minutes past 7 in the morning: making again equal day and night to all the world. The

Pond 1655.

qualities now predominant are cold and dry, like to the complexion melancholy, and declining state of man. Now husbandmen in their endlesse circle, beginning to provide for the crop of the following year, have their land prepared by some few showers caused by the morning setting of the *Pleiades*, *Hyades*, and *Orion*: which moisture, lest it should hurt the new sown grain and sprouting blade by the sudden approach of cold, the sunne while he passeth through *Sagittarius*, a signe of qualitie hot and fiery, doth (as he can according to his distance from us) draw out the residue of it, and settleth the earth for the entertainment of the cold.

Winter quarter.

{	December	}	Di	}	Gumadi 2	}	Chiac	}
{	January	}	Behemen	}	Regab	}	Tuba	}
{	February	}	Asphandar	}	Schaban	}	Amſchir	}

Winter quarter begins at the suns entrance into the tropicall signe *Capricorn*, which he doth the eleventh day of *December* at 17 minutes past 7 in the afternoon, making then the shortest day and longest night to all on this side the equator, the day with us at *Cambridge* then being seven houres, 26 minutes, twenty four seconds. The temper is now cold and moist, phlegmaticque, like to our decrepit state; in both much superfluous humiditye

Pond 1655.

ditie doth abound. The earth seems now to lie still and to be quiet, that it may recover the strength spent in the last summers productions: wanting a richer, its oft robed with a vest of snow; which yet is observed not feldome to promise ensuing plenty. Toward the end of this quarter, the sunne approaching in *Pisces*, accompanied with some warmer Western winds, prepares the earth to entertain the ever-welcome Spring.

*Under that spangled vault, the starry sphere,
If Titans course should onely every yeare
The weathers temper change, then plainly we
The next yeares weather might in this foresee.
Compare two yeares, and there but little want,
But the same day same starres are culminant:
Their risings, settings on the same day fall,
Acronique, Cosmique, and Heliacall.
This constancy would yield to no mutations,
Did not the planets oft consociations
Their power interpose: by whose aspects
I'th' heaven are caus'd those various chang'd effects.
Their various course is such, so strange their race,
The earth ne're saw them twice unchang'd in face.
This Protean mixture of the seven together,
Will cause a Protean dayly change of weather.*

How to find the age of the Moon.

ADde to the *Epact* the number of moneths from the beginning of *March*, together with the moneth wherein you seek, and also the number of dayes past of that moneth wherein you seek, and such addition will shew you the age of the moon, if the summe of addition be lesse then 30; but if the summe of addition doth exceed 30, then subtract 30, and the remainder shall be the age of the moon, so as the moneth wherein you seek hath 31 dayes; for if it hath lesse then 31 dayes, you must subtract but 29, & the remainder shall be the age of the moon.

Pond 1655.

To know the time of the Tides in a more exact and ready manner, then heretofore hath been set forth by any.

The use followeth.

Dayes after the Change, or Full, the Moon is South at

0	1	2	3	4	5	6	7
12	12 48	1 36	2 24	3 12	4 0	4 48	5 36

Dayes after either of the Quarters, the Moon is South at

0	1	2	3	4	5	6	7
6	6 48	7 36	8 24	9 12	10 0	10 48	11 36

First find the new moon, full, or quarter, in the kalender; then count how many dayes are past either of those, and under the same number of dayes past, you shall here see the time that the moon will be south the same day: then look for the Haven or Port you desire, and where the houres and quarters stand before the same, there it is high-water so many houres and quarters before the time above found: but where the houres and quarters stand after the place, there it is high-water so long after the time first found.

As for examp^{le}.

The Moon being five dayes past the change, and so five dayes old, I find in the table, that five dayes after the change the Moon is South at four a clock, which makes full sea at *Quinborough, Southampton, &c.* but at *Yarmouth, Dover, Harwich*, an hour and a half sooner, that is at two a clock and thirty minutes: but at *London, Tinnmouth, and Amsterdam* three houres after.

H. Quart.	Quinborough, Southampton, Portsmouth, Welling
0 3 quart.	Rye, Callice, Callhot, Winchelsea, Gorend
1 2 quart.	Yarmouth, Bulloigne, Dover, Harwich, Wight

Falmouth, Foy, Garnley, Severn-mouth, Waterford	4 2 quart.
	5 1 quart.

Astro-

Astrologickall Elections, &c. briefly described for
administration of Phylick and Phlebotomie.

AS in all other parts of Phylick, so in phlebotomie, or letting of blood, first skilfully and circumspectly is to be considered and certainly known the cause: As whether it be needfull and good to the patient, as that it be to purge the body of some unnaturall, naughty, and superfluous humour. For otherwise, letting of blood is very dangerous, and openeth the way to many grievous infirmities. And note generally, that it is not convenient, either for a lean and weak man, or for a very fat and grosse man to be let blood, neither for a child under 14 yeares of age, nor an old man above 56.

Now there remaineth to be considered, how it standeth with the patient inwardly, for his complexion and age; and outwardly, for the time of the year, time of the day, and diet.

For the	{	Phlegmatick	{	The	{	Aries or Sagittarius.
complexi-		Melancholick		Moon		Libra or Aquarius.
on; Let		Cholerick		being		Cancer or Pisces.
blood the		Sanguine		in		either of these.

For his	{	YOUTH, from the change to the first quarter.
age; Let		Middle age, from the first quarter to the full.
blood in		Elder age, from the full to the last quarter.
his		Old age, from the last quarter to the change.

The time of the Year.

Spring good. Harveſt indifferent.

For the time of the Moneth.

Let not blood	{	The moon in Taurus, Gemini, Leo, Virgo, or Capric.
		The day before nor after the change and full.
		Twelve houres before and after the quartiles.
		The moon with Jupiter or Mars evil aspected.

The time of the Day.

Morning after ſun-riſing, faſting: after noon, after perfect digeſtion: the air temperate, the wind not ſouth.

Diet

Pond 1655.

Diet after bleeding.

Sleep not presently, Stirre not violently,
Use no venericie, Feed thou warily.

Notwithstanding, for the Phrensie, the Pestilence; the Squinancy, the Plurisie, the Apoplexie, a continuall Headach growing of choler or bloud, a hot burning Fever, or any other extreme pain, in this case a man may not tarry a chosen time but incontinently, with all convenient speed, he is to seek his remedie: but then bloud is not to be let in so great a quantitie as if a chosen time might be respected.

Good to	{	Prepare humours	the Moon in	{	Gemini, Libra, or Aquarius.
		Vomit			Aries, Taurus, or Capricorn.
		Purge by neezing			Cancer, Leo, or Virgo.
		Take clysters			Aries, Libra, or Scorpio.
		Take gargarismes			Cancer, or Aries.
		Stop rheumes and flux			Taurus, Virgo, or Capricorn.
Burge with	{	Bath for cold diseases	the Moon in	{	Aries, Leo, or Sagittarius.
		Bath for hot diseases			Cancer, Scorpio, or Pisces.
Burge with	{	Electuaries,	the Moon in	{	Cancer.
		Potions,			Scorpio.
		Pills,			Pisces.

The opinion of William Bullein.

Quamvis Medicina de se Scientia sit perfecta, Medicus tamen in opere suo sine Astrologia non est perfectus.

Although Physick is a perfect science of it self, yet a Physician cannot be perfect in his work without Astrologie.

FOr that in us all things may vein appeare.
A vein we have for each day in the yeare.

The proportion of the pound *Avoir-du-pois* to the pound Troy, is as 60 to 73; so that 60 pounds *Avoir-du-pois* are equal to 73 pounds Troy. The proportion of the ounce Troy to the ounce *Avoir-du-pois*, is as 73 to 80; so that 73 ounces Troy, are equal to 80 ounces *Avoir-du-pois*. Therefore the pound *Avoir-du-pois* is greater then the pound Troy: and the ounce Troy is greater then the ounce *Avoir-du-pois* by 42 grains.

Wheat at 5 shillings the Bushell or Strike, The town-bakers penny white, is (by Troy) 7 ounces, 7 penny weight: by *Avoir-du-pois* 8 ounces: And the Countrey-bakers penny white (by Troy) 7 ounces 13 penny weight: by *Avoir-du-pois* 8 ounces and one quarter. If the baker want one ounce in 36 ounces of this affize, he shall suffer the Pillorie, without any fine or admonition, 51 Hen. 3.

FINIS.
